WEB APPLICATION FOR DETAILING DOMAIN UTILIZATION

CLIENT SIDE SUMMARY

Our Client needed a website that portrays the statistical information of multiple domains in a conclusive manner. He wanted a platform to allow its customers to select their domain from a list and get its information represented in an illustrative manner. He wanted the application to fetch information from two different sources: Google Analytics and the Hosting Server to generate graphs. His sole motive was to allow his clients select their domain from a list, and analyze the detailed information of its visitors, and their visits.

THE CLIENT

Location: Wellesley (USA)

SURETEK SOLUTION

Suretek provided an accurate solution to the client, by providing a user-friendly platform for selecting the domain. It further fetches the information from the Google Analytics for that domain. Next the information from the FTP log is retrieved and the combined information is analyzed to yield statistical results. These results are then processed to produce bar/ line/ pie charts and histograms to represent the analytic aspect of domain utilization to the respective client. The features include:

- Maintaining Google Analytics database.
- Maintaining FTP log database.
- Updating data per day.
- A web interface for selecting and viewing the visitor's information regarding a particular domain.
.

TECHNOLOGIES USED

.NET 3.5(C#), ASP.Net, Ajax, J-Query, SQL Server 2008, FTP Server
